### 3.3 Problems DE-3

### 3.3.1 Topics of this homework: Brune impedance

lattice transmission line analysis

### 3.3.2 Brune Impedance

## Problem \# 1: Residue form

A Brune impedance is defined as the ratio of the force $F(s)$ to the flow $V(s)$ and may be expressed in residue form as

$$
\begin{equation*}
Z(s)=c_{0}+\sum_{k=1}^{K} \frac{c_{k}}{s-s_{k}}=\frac{N(s)}{D(s)} \tag{DE-3.1}
\end{equation*}
$$

with

$$
D(s)=\prod_{k=1}^{K}\left(s-s_{k}\right) \quad \text { and } \quad c_{k}=\lim _{s \rightarrow s_{k}}\left(s-s_{k}\right) D(s)=\prod_{n^{\prime}=1}^{K-1}\left(s-s_{n}\right)
$$

The prime on the index $n^{\prime}$ means that $n=k$ is not included in the product.

- 1.1: Find the Laplace transform (LT) of a (1) spring, (2) dashpot, and (3) mass.

Express these in terms of the force $F(s)$ and the velocity $V(s)$, along with the electrical equivalent impedance: (1) Hooke's law $f(t)=K x(t)$, (2) dashpot resistance $f(t)=R v(t)$, and (3) Newton's law for mass $f(t)=$ $M d v(t) / d t$. Ans:

- 1.2: Take the Laplace transform $(\mathcal{L T})$ of Eq. DE-3.2 and find the total impedance $Z(s)$ of the mechanical circuit.

$$
\begin{equation*}
M \frac{d^{2}}{d t^{2}} x(t)+R \frac{d}{d t} x(t)+K x(t)=f(t) \leftrightarrow\left(M s^{2}+R s+K\right) X(s)=F(s) \tag{DE-3.2}
\end{equation*}
$$

Ans:

## Ans:

- 1.4: Assume that $M=R=K=1$ and find the residue form of the admittance $Y(s)=1 / Z(s)$ (see Eq. DE-3.1) in terms of the roots $s_{ \pm}$. Hint: Check your answer with Octave's/Matlab's residue command.
Ans:
- 1.5: By applying Eq. 4.5.3 (page 151), find the inverse Laplace transform $\left(\mathcal{L T}^{-1}\right)$. Use the residue form of the expression that you derived in question 1.4.

## Ans:

Figure 3.1: Depiction of a train consisting of cars treated as masses $M$ and linkages treated as springs of stiffness $K$ or compliance $C=1 / K$. Below it is the electrical equivalent circuit for comparison. The masses are modeled as inductors and the springs as capacitors to ground. The velocity is analogous to a current and the force $f_{n}(t)$ to the voltage $\phi_{n}(t)$. The length of each cell is $\Delta$ [ m ]. The train may be accurately modeled as a transmission line (TL), since the equivalent electrical circuit is a lumped model of a TL. This method, called a Cauer synthesis, is based on the ABCD transmission line method of Sec. 3.8 (p. 107).

### 3.3.3 Transmission-line analysis

Problem \# 2:(14 pts) Train-mission-line We wish to model the dynamics of a freight train that has $N$ such cars and study the velocity transfer function under various load conditions.

As shown in Fig. 4.9, the train model consists of masses connected by springs.

## Problem \# 3: Transfer functions

Use the ABCD method (see the discussion in Appendix B.3, p. 228) to find the matrix representation of the system of Fig. 4.9. Define the force on the $n$th train car $f_{n}(t) \leftrightarrow F_{n}(\omega)$ and the velocity $v_{n}(t) \leftrightarrow V_{n}(\omega)$.

Break the model into cells consisting of three elements: a series inductor representing half the mass $(M / 2)$, a shunt capacitor representing the spring $(C=1 / K)$, and another series inductor representing half the mass ( $L=M / 2$ ), transforming the model into a cascade of symmetric $(\mathcal{A}=\mathcal{D})$ identical cell matrices $\mathcal{T}(s)$.

- 3.1: Find the elements of the ABCD matrix $\mathcal{T}$ for the single cell that relate the input node 1 to output node 2

$$
\left[\begin{array}{c}
F  \tag{DE-3.3}\\
V
\end{array}\right]_{1}=\mathcal{T}\left[\begin{array}{c}
F(\omega) \\
-V(\omega)
\end{array}\right]_{2} .
$$

Ans:

- 3.2: Express each element of $\mathcal{T}(s)$ in terms of the complex Nyquist ratio $s / s_{c}<1$ ( $s=2 \pi j f, s_{c}=2 \pi j f_{c}$ ). The Nyquist wavelength sampling condition is $\lambda_{c}>2 \Delta$. It says the critical wavelength $\lambda_{c}>2 \Delta$. condition is $\lambda_{c}>2 \Delta .{ }^{2}$ It says the critical wavelength $\lambda_{c}>2 \Delta$. Namely it is defined in terms the minimum number of cells $2 \Delta$, per minimum wavelength $\lambda_{c}$.
The Nyquist wavelength sampling theorem says that there are at least two cars per wavelength.
Proof: From the figure, the distance between cars $\Delta=c_{o} T_{o}[\mathrm{~m}]$, where

$$
c_{o}=\frac{1}{\sqrt{M C}} \quad[\mathrm{~m} / \mathrm{s}] .
$$

[^0]The cutoff frequency obeys $f_{c} \lambda_{c}=c_{o}$. The Nyquist critical wavelength is $\lambda_{c}=c_{o} / f_{c}>2 \Delta$. Therefore the Nyquist sampling condition is

$$
\begin{equation*}
f<f_{c} \equiv \frac{c_{o}}{\lambda_{c}}=\frac{c_{o}}{2 \Delta}=\frac{1}{2 \Delta \sqrt{M C}} \quad[\mathrm{rad} / \mathrm{sec}] \tag{DE-3.4}
\end{equation*}
$$

Finally, $s_{c}=\jmath 2 \pi f_{c}$.
Ans:

- 3.3: Use the property of the Nyquist sampling frequency $\omega<\omega_{c}(E q . D E-3.4)$ to remove higher order powers of frequency

$$
\begin{equation*}
1+\left(\frac{s}{s_{c}}\right)^{2^{0}} \approx 1 \tag{DE-3.5}
\end{equation*}
$$

to determine a band-limited approximation of $\mathcal{T}(s)$.
Ans:

Problem \# 4: (4 pts) Now consider the cascade of $N$ such $\mathcal{T}(s)$ matrices and perform an eigenanalysis.

- 4.1: (4 pts) Find the eigenvalues and eigenvectors of $\mathcal{T}(s)$ as functions of $s / s_{c}$.

## Ans:

Problem \# 5: (14 pts) Find the velocity transferfunction $H_{12}(s)=V_{2} /\left.V_{1}\right|_{F_{2}=0}$.

- 5.1: (3 pts) Assuming that $N=2$ and $F_{2}=0$ (two half-mass problem), find the transfer function $H(s) \equiv V_{2} / V_{1}$. From the results of the $\mathcal{T}$ matrix, find

$$
H_{21}(s)=\left.\frac{V_{2}}{V_{1}}\right|_{F_{2}=0}
$$

Express $H_{12}$ in terms of a residue expansion.
Ans:

- 5.2: (2 pts) Find $h_{21}(t) \leftrightarrow H_{21}(s)$.

Ans:

- 5.3: (2 pts) What is the input impedance $Z_{2}=F_{2} / V_{2}$, assuming $F_{3}=-r_{0} V_{3}$ ?

## Ans:

- 5.4: (5 pts) Simplify the expression for $Z_{2}$ as follows:

1. Assuming the characteristic impedance $r_{0}=\sqrt{M / C}$,
2. terminate the system in $r_{0}: F_{2}=-r_{0} V_{2}$ (i.e., $-V_{2}$ cancels).
3. Assume higher-order frequency terms are less than $1\left(\left|s / s_{c}\right|<1\right)$.
4. Let the number of cells $N \rightarrow \infty$. Thus $\left|s / s_{c}\right|^{N}=0$.

When a transmission line is terminated in its characteristic impedance $r_{0}$, the input impedance $Z_{1}(s)=r_{0}$. Thus, when we simplify the expression for $\mathcal{T}(s)$, it should be equal to $r_{0}$. Show that this is true for this setup.

Ans:

- 5.5: (1 pts) State the ABCD matrix relationship between the first and Nth nodes in terms of the cell matrix. Write out the transfer function for one cell, $H_{21}$.

## Ans:

- 5.6: (1 pts) What is the velocity transfer function $H_{N 1}=\frac{V_{N}}{V_{1}}$ ?

## Ans:

[^0]:    ${ }^{2}$ The history of this relation has been traced back to 1841, as discussed by (Brillouin, 1953, Chap. I,II, Eq. 4.7).
