Jont,

Attached are the datasheets.

Good mic: FG44-31993

Bad (new) mic: FG-23629 (DC voltage drift)

The Knowles website advertises "The BFG is an improved version of the FG microphone and offers enhanced PFA performance and power-on reset for instant settling time." Does this mean we need a BFG rather than FG?

We can also test the mics we did not order (FG-23329 or FG-30077) to see if they have the DC voltage issue.

Sarah
