	Abstract	In the beginning
Concepts in Engineering Mathematics Mathematics and its History by John Stillwell Jont B. Allen UIUC Urbana IL, USA December 26, 2015	It is widely acknowledged that <i>interdisciplinary science</i> is the backbone of modern scientific research. However such a curriculum is not taught, in part because there are few people to teach it, and due to its inherent complexity and breadth. Mathematics, Engineering and Physics (MEP) are at the core of such studies. To create such an interdisciplinary program, a unified MEP curriculum is needed. This unification could take place based on a core mathematical training from a historical perspective, starting with Euclid or before (i.e., Chinese mathematics), up to modern information theory and logic. As a bare minimum, the <i>fundamental theorems of mathematics</i> (arithmetic, algebra, calculus, vector calculus, etc.) need to be appreciated by every MEP student. At the core of this teaching are 1) partial differential equations (e.g., Maxwell's Eqs), 2) linear algebra of (several) complex variables, and 3) complex vector calculus (e.g., Laplace transforms). If MEP were taught a common mathematical language, based on a solid training in mathematical history [?], students would be equipped to 1) teach and exercise interdisciplinary science and 2) easily communicate with other M, E, and P scientists. The idea is to teach the history of the development of these core topics, so that the student can fully appreciate the underlying principles. Understanding these topics based on their history (e.g., the people who created them, what they were attempting to do, and their basic mind-set), makes the subject uniformly understandable to every student. The present method, using abstract proofs, with no (or few) figures or physical principles, lacks the intuition and motivation of the original creators of these theories. Such a sterile approach is not functional for many students, resulting in their poor intuition.	 The very first documented mathematics: Chinese 5000 BC (aka BCE) Babylonians (Mesopotamia/Iraq) 1800 BCE Archimedes 300 BCE Geometric series Vol of sphere, Area of Parabola Hydrostatics Euclid active in Alexandria during the reign of Ptolemy I ≈323 BCE Euclid's <i>Elements</i> is (was?) the most influential works of mathematic Geometry every student is assumed to learn in High School Burning of the Library of Alexandria results in the destruction of 'Al recorded knowledge' 391 BCE

Arithmetic); Euclid algorithm: Greatest Common prime Divisor (Ex: 15=3*5, 30=2*3*5: gcd=3) Negative integers: 628 AD Brahmagupt used negative numbers to represent debt. Zero: By the ninth century zero had entered the Arabic numeral system Real numbers: Pythagoras knew of irrational numbers (√2) Complex numbers: 1572 "Bombelli is regarded as the inventor of complex numbers http://www-history.mcs.st-andrews.ac.uk/Biographies/Bombelli.html http://en.wikipedia.org/wiki/Rafael_Bombelli & p. 258 Power Series: Gregory-Newton interpolation formula c1670, p. 175 Point at infinity and the Riemann sphere 1850 Analytic functions p. 267 c1800; Analytic Impedance Z(s) 1893
 Outcomes: Roots of systems of polynomials Fundamental theorem of: Arithmetic Calculus Algebra, Other key outcomes: Complex analytic functions (complex roots are finally accepted!) Complex Taylor Series of complex numbers (ROC) Riemann mapping theorem Cauchy Integral Theorem (Residue integration (i.e., Green's Thm)) Laplace Transform and its inverse Complex Impedance (Ohm's Law) 1893: A. Kennelly 1861-1939: 	14.6 The Fundamental Theorem of Algebra Fundamental theorem of algebra : Every polynomial equation p(z) = 0 has a solution in the complex numbers. As Descartes observed, a solution $z = a$ implies that $p(z)$ has a factor $z - a$. The quotient $q(z) = p(z)/(z - a)$ is then a polynomial of lower degree. We can go on to factorize $p(z)$ into n linear factors. d'Alembert (1746) observed that for polynomials $p(z)$ with real coefficients, if $z = u + iv$ is a solution of $p(z) = 0$, then so is its conjugate $z^* = u - iv$. Thus the imaginary linear factors of a real $p(z)$ can always be combined in pairs with real coefficients. p. 285	 Pythagoras's end The Pythagoras Theorem (PT) is the oldest "math cornerstone" PT is the entrypoint to three main streams in mathematics Numbers Z₊, Z, Q, R, C, F (i.e., Int, Rats, Reals, Complex, Functions Geometry (e.g., lines, circles, spheres, toroids,) Infinity (irrationals, limits, ∞) The Pathagoreans were destroyed by fear: Whether the complete rule of number (integers) is wise remains to be seen. It is said that when the Pythagoreans tried to extend their influence into politics they met with popular resistance. Pythagoras fled, but he was murdered in nearby Metapontum in 497 pcc. p. 16

Real numbers ${\mathbb R}$	Pythagorean Motto: All is number	Mapping the multi-valued square root of $w = \pm \sqrt{x + iy}$	
 Once irrational numbers were appreciated, it became clear that <i>real</i> numbers ℝ must also exist This appreciation came slowly Integers are a subset of reals Prime numbers are a special subset of integers 	 Integers were linked to Physics: i.e., Music and Planetary orbits The identification of irrational numbers spoiled this concept Yet today: With the digital computer, digital audio, and digital video coding everything, at least approximately, [is transformed] into sequences of whole numbers, [thus] we are closer than ever to a world in which "all is number." p. 16 	• This provides a deep (essential) analytic insight. 15.3 Branch Points 303 and video formed]
